Mar 5, 2020 Seagate Backup Plus Turbo . speed, reliability, and best-in-class backup capacity of the ultra-thin line of products: Seagate Backup Plus Turbo. Seagate Backup Plus Turbo provides large volumes of data protection that are . Category:Backup softwareQ: How to improve a proof of the distributivity of weak convergence in Hilbert spaces? I'm trying to make a somewhat precise proof that the weak convergence  $y_n \rightharpoonup y$  is distributive for  $x \in D(A)$  and  $\alpha \in [0, 1]$ , where  $D(A)$  is the domain of  $A$ , and  $D(A) = \{y \in H: Ay \in H\}$ ; and  $A: D(A) \subseteqq H \rightarrow H$  is some linear operator. Suppose  $x_n \rightarrow x$  strongly in  $H$  and  $\alpha_n \rightarrow \alpha$  weakly in  $H$ . Now, I want to show that  $\|y_{n+\alpha_n} - Ax_n - y - \alpha Ax\| \rightarrow 0$  as  $n \rightarrow \infty$ . Now, if we suppose that  $y \in D(A)$ , then I think I can easily show that

---

$\|y_n - y\| \rightarrow 0$ , since  $y_n \rightarrow y$  weakly and  $H$  is a Hilbert space, so  $\|A(y_n - y)\| \rightarrow 0$ . However, what if  $y \notin D(A)$ ? I know it suffices to prove that  $y_n + \alpha_n A x_n \rightarrow y + \alpha A x$  in the weak topology (or even in the norm topology if  $A$  is a closed operator), but I don't see how to do that in the case  $y \notin D(A)$ . A: Indeed, it suffices to show that  $y_n + \alpha_n A x_n \rightarrow y + \alpha A x$  in weak sense. Consider  $\lambda_n = y_n - y$  and  $\mu$

The present invention is directed to a lighting fixture for a display case or case display in which the lighting fixture is formed as part of a panoply of luminaires. More particularly, the present invention is directed to a lighting fixture in which the light beam is directed out of the fixture in a direction parallel to the plane of the fixture. The lighting fixture also has the advantage of being able to operate in a greater ambient light environment. U.S. Pat. No. 4,262,348 discloses a lighting fixture formed of a number of tubular luminaires and comprising a diffuser. The diffuser comprises a tubular body portion and a conical shaped portion extending away from the tubular body portion. A light source is provided on the inside wall of the tubular body portion. The diffuser has a convex inwardly extending surface in contact with a light guiding element. The light is deflected by the wall to be guided out of the diffuser in a direction essentially parallel to the inside surface of the diffuser. U.S. Pat. No. 4,923,170 discloses a lighting fixture having a light source and a reflective element disposed within a tubular body. A portion of the light is reflected by the reflective element and guided outwardly of the fixture. U.S. Pat. No. 5,010,679 discloses a fluorescent tube with an outer reflector sleeve and a fluorescent tube with an inner reflector sleeve. The reflector sleeve defines a recess in which the fluorescent tube is disposed. Light is reflected away from the reflective sleeve and around the fluorescent tube. U.S. Pat. No. 5,123,847 discloses a fluorescent lighting fixture in which a fluorescent tube has a reflector sleeve disposed about the fluorescent tube. U.S. Pat. No. 5,246,922 discloses a luminaire having a reflector portion which includes a flat back plate and an optical fiber to guide the light to the outside of the reflector. U.S. Pat. No. 5,281,100 discloses a luminaire having a reflector member with a reflector plane which is parallel to a light source. The reflector extends from a short side of the reflector member to an elongated side of the
