The northern lights are made up of both light emitted from charged particles in the solar wind as well as light reflected off the auroral curtains and charged particles in the earth's atmosphere. The northern lights (aurora borealis) are beautiful dancing waves of light that have captivated people for millennia. When solar winds encounter the earth's magnetic field, the charged particles in the solar wind bounce off the earth's magnetic field lines and are captured by the earth's magnetic field. The charged particles in the earth's atmosphere bounce off the charged particles in the earth's magnetic field and the light emitted from the moving charged particles is emitted into space. The emission of light is greatest at the ends of the earth's magnetic field where the auroral curtains are located, and is greatest at the poles. As the earth rotates, the north and south poles of the earth move away from the auroral curtains. This changes the orientation of the earth's magnetic field, creating new north and south poles. This is where the aurora is most visible. From the ground, the aurora is usually visible as streaks of light but when it is most intense, the aurora can be seen as curtains of light at the earth's poles. In the Arctic, the aurora can be seen as curtains of light which arc across the sky as the earth turns. Although the aurora can be seen at night in the summer months, the brightness and frequency of the aurora is greater in the winter. The aurora appears as streaks of light with the brightest streaks coming from the direction of the sun. The aurora is most frequently seen in the northern and southern hemispheres. The northern lights are also often called the "ruddy glow" of the sky, and are often visible in western North America, the Arctic, and much of Europe. The southern lights are known as the "green glow" of the sky and are seen mostly in the southern hemisphere. Seashell Disco Balls - Arguably the most obscure and awesome site in the wide, wide world of the internet is the "Autumn Sea Balls of Wales." I remember having first seen this in a speech given by professor Philip Dixon-Smith of the National Gwynedd Museum. I was so mesmerized that I almost forgot to finish the speech. Look at this, and you will see more dots of light than you can count! What can this be? We have no idea. In 1997 it was first observed by three people at

The Northern Lights are potentially visible under dark skies from late August to mid-April, preferably with clear, cloudless skies. However, they take place all year round. However, as a rule, they occur only in the summer, and only during certain periods (usually from about November to February) and throughout the globe. fffad4f19a
