Objective: To examine whether there were differences in quality of life (QOL) among patients with dementia who had been randomly assigned to olanzapine or risperidone treatment. Method: We conducted a prospective, randomized, open-label trial of two treatment groups with a 12-week follow-up. The QOL of the participants was evaluated using the Alzheimer's Disease Quality of Life (ADQOL) scale. Results: Of the participants, 55% had a diagnosis of Alzheimer's disease (AD). Twenty-nine participants completed both baseline and follow-up measures. Compared with baseline, 12 weeks after initiating treatment, both olanzapine and risperidone treatment groups showed significant improvements in scores on the ADQOL total and subscales, including environment, mental health, and life stability. The only significant difference was that in the QOL of the living environment subscale, which was significantly better in the risperidone group. Conclusions: Both olanzapine and risperidone treatment improve the QOL of patients with dementia, although there was a trend for the olanzapine group to improve more in QOL than the risperidone group.
