Logical Database Diagrams Microsoft CRM relational database design concept of a relational database model uses the concept of transactional data. This type of data is created, edited, and erased in a consistent manner. Transactional data is usually used to maintain real-time data (e.g., transactions) or save data for later use. This kind of data is typically the most frequently used in an organization. Every effort should be made to make sure that the data that gets stored in the system is valid and is accurate. This data should be user-friendly and should reflect as close to reality as possible. Microsoft SQL Server or Microsoft Access's Transaction Log can be used to store information about transaction data. The logical database diagram shows the structure for the "Crm 3.0" database. The logical database is where "CRM" operations are executed, and all of the three entities are supported, including the entities found in the "Users" database. For example, when you save a record in the Crm 3.0 database, the record is saved in the "Crm 3.0" database (in "Inheritance" mode). The "Users" database is used as the data foundation, and is the target data store for CRM application user accounts. The Sales Force Automation Entities (SFA) shows the record structure for the "Salesforce.com" service (Sales Cloud, Salesforce.com, or Service Cloud) hosted applications. It is used for Salesforce CRM customer accounts. The "Salesforce.com" record in CRM is currently used for saving Case and Contracts. The Salesforce.com records are stored in the Salesforce.com data store, while the "Crm 3.0" record is stored in the "Crm 3.0" data store. The Logical Database Diagram allows you to see the structure of "CRM" objects that are associated with each other and other objects in the system. Diagram Options The following diagrams illustrate how to set the display options for the CRM logical diagram. The following steps show how to set the display options for the Sales Force Automation record in the "CRM" database. Set the display options for the Sales Force Automation record. The default diagram setting is to display all of the entity objects. Go to the Object Navigator of the Crm 3.0 database (using CRM Designer). Select Sales Force Automation. Then, select the Entity Properties, as shown in the following steps. In the Entity Properties dialog box, go to the Settings tab, and then select the Display options. Select the All entities, as shown in the following steps. Select the All entities. IMPORTANT: Select the All entities check box only when you are discussing all entity types, including the Sales Force Automation entities. In the Sales Force Automation Entity Diagram, select which entities to display in the diagram. In the Sales Force Automation Entity Diagram, select the Sales Force Automation. In the Entity Filter dialog box, select all of the check
