Q: How to measure the power consumption of small microprocessor? I am new in studying electronics, please help me check my wrong thinking. Here is the situation. I am developing a microprocessor, and I want to measure the power consumption of the microprocessor when it executes some simple instructions. The microprocessor is quite small (1mm square, 8/16/32/64 pins), and it has a 5V power source. My first idea: I connect the ground and power leads of the microprocessor to the 2.2k resistor R1, and the power leads of the resistor R1 to the 5V power source. I also connect one LED on the ground and power leads of the microprocessor. I am wondering, if I am connecting the ground and power leads correctly, the current through the resistor R1 is as small as 1/20 of the current through the microprocessor, so it will not burn the microprocessor in too short time. But my second thought is: I don't have to connect the ground and power leads of the resistor R1 to the ground and power leads of the microprocessor, and I have to connect the resistor R1 to the power source with a 100k resistor, then the current through the resistor R1 will be much more than the current through the microprocessor, so the microprocessor will be burned in a short time. Is my thinking wrong? A: If you want to measure the power consumption of your MCU you probably need a supply with a known current, at least 100mA, and a resistor between that supply and the microcontroller. You can choose the value of that resistor depending on how much current you want to sample, with respect to your power source. The MCU should be connected to ground, but only via a microcontroller pin, not through the substrate. In other words, you don't need to connect the power rail of the MCU to the ground rail, only to the MCU pin, or to a specific microcontroller pin. Note that the output impedance of MCUs are quite small, compared to the current you would measure. You want to choose a current of at least 100mA. If you want to measure the voltage drop between supply and ground at 100mA current and a voltage of 5 V, the equivalent resistance is 10 kOhms. That means that you should be able to measure a voltage difference of 1 mV,

Q: C++ fstream read method I'm new at C++, and I'm wondering if the following code is properly defined:

```
typedef void (*cERROR)(const int); class ErrorSink { public: typedef void (*cERROR)(const int); ErrorSink(const char *msg = NULL) : m_cERROR(NULL) { if (msg) m_cERROR = error_sink; } ErrorSink(cERROR f) : m_cERROR(f) { } ErrorSink &write(const char *msg); private: cERROR m_cERROR; }; ErrorSink &ErrorSink::write(const char *msg) { m_cERROR(); } class StreamReader {
```

```
public: StreamReader(const char *msg) : m_s(NULL) { if (msg) m_s = fstream(msg, ios_base::in); }
operator istream&() const { return m_s; } istream &operator >> (cERROR f) { if (m_s.fail()) return
m_s; m_s >> f; return m_s; } private: fstream m_s; }; int main() {
