*This macro can be used to make your 'Enter' key behave as the

'Tab' key on Windows. This will allow you to use it as the 'Tab' key from your favorite text editor (such as Notepad). It is highly advised that you use a USB keyboard if you use the terminal this way. *Of course, you are free to use any key with this macro. For example, you can use the letter 'S' on your keyboard as a 'Tab' key. If you are using a mouse to move your cursor, there is a good chance that you will have a nagging feeling that your cursor is jumping all over the place. This guide will take a look at a couple of tweaks that can help solve this annoying problem. The first thing to check is whether the pointer is getting out of control by disabling the blinking cursor. Open the mouse settings page by right-clicking on your mouse and selecting "Mouse Settings". You will see a list of options for the pointer's behaviour on your mouse; a brief description of each is listed below. No Blinking: For those who are after a super-steady cursor, this option will make the pointer stop blinking. However, this option does not provide much comfort for those who like to use their mouse at high speed. Medium Blinking: This option makes the pointer blink once for each mouse movement. The great thing about this option is that it makes the cursor more sensitive, but it does not move as fast as the no blinking option. Fast Blinking: When the cursor is moved very quickly, it becomes hard to control it. You can use this option to move the cursor faster than you would be able to otherwise, but it also makes it very hard to control the cursor. The middle option (Medium Blinking) should be just what you are looking for, as it offers you the best of both worlds.

Although the medium option will make it a little slower to move the cursor, the absence of blinking will make it easier to control the cursor. If you're trying to figure out what the Windows 7 taskbar can do that the OS X dock can't, you're in the right place. Here's a list of seven ways Windows 7's taskbar can make your life easier, by augmenting your current OS X setup. 1.

mintty is a lightweight, portable application that was developed so that it can replace PuTTY by serving you as a terminal emulator for Cygwin (the Unix-like environment for Windows operating systems) on your computer. This tool was designed to help seasoned computer users such as software developers, coders and programmers get the most out of their setup. It is worth mentioning that, in a similar manner to other pty-based Cygwin terminals, this application cannot possibly server as a complete replacement for Windows' native Command Prompt utility and can only serves some specific purposes. mintty comes with a native Windows user interface and does not require a display server to run on the target computer. More so, the terminal emulation of this application aims to be compatible with xterm, which is an improvement from the terminal emulation and Windows frontend components of PuTTY. The

processes running within mintty communicate with the help of the POSIX API (which is provided by Cygwin), while the user interface is implemented making use of the Windows API. It provides users with a whole bunch of cool features such as 256-colour and True-Colour support, wide range of character encoding support, Emoji support, alternative fonts, colour schemes, drag & drop capabilities as well as virtual tabs.
