Key Features Drawings storage and rendering Most AutoCAD models are stored in 2D-Bounding Boxes (2DBB) which can be represented by a B-Rep. Some models are stored in 3D-Bounding boxes (3DBB) which can also be represented by a B-Rep. In most cases the model is rendered by the interface. Models can be kept for further reference, but they cannot be edited except in simple cases. They are stored on the hard disk in a binary format. Usually, the use of a database is avoided to prevent scalability issues. AutoCAD has a command-line interface to import and export models in file format DXF. This feature was deprecated in

AutoCAD 2013, but still supported in 2016 as well as the Windows Software Development Kit (SDK). CAD tools The tools menu includes both drawing tools and operations, such as an option to export in DXF format, and several menus such as engineering, drafting, 3D modeling and others. Cross-sectional study of 5-month-old infants' attention to human speech and the role of social expectations in infant speech perception. To study infant attention to human speech in its natural acoustic context, an experimental design was used. Four-month-old infants were exposed to continuous speech stimuli with and without context in which human-like vocalizations were regularly produced. Cross-sectional data were obtained on the behavioral responses of the infants during these presentations. The predominant response of 4-month-old infants was to attend in a preferential manner to the parts of speech that contained human-like vocalizations (human and infant vocalizations). These data showed that 4-month-olds are able to discriminate the speech signals that contain human-like vocalizations from speech signals that contain other kinds of vocalizations. The results also showed that infants differentiate between human-like vocalizations made in the context of human speech and those in the context of nonhuman speech. The relative amount of attention to human vocalizations was influenced by the presence of context in which human-like vocalizations were regularly produced. The results from the current study may be useful for the development of early language teaching programs.

Helicobacter pylori and chronic peptic ulcer disease. It has been known for over two decades that a diverse array of gastroduodenal diseases can result from the presence of a bacterium in the lumen of the human stomach, and more recently, this paradigm has been extended to suggest a relationship of Helicobacter pylori to an increasing number of extragastric malignancies. The epidemiologic evidence indicates that the prevalence of H. pylori infection is approximately 30% in the Western world, and that this represents a major public health problem. The etiologic agent is a gram-negative microaerophilic bacterium of the spiral type, and two H. pylori strains, A and B, have been characterized by all major investigators. Some, but not all, evidence suggests that a close genetic relationship exists between these strains. Most of the clinical studies involving the influence of H. pyl
